## HYDROSEEDING

Our hydroseeding services are designed to assist with revegetation and to suppress soil dust, in a multitude of situations

helicopter hydroseeding

heritage sites

subdivision/residential

golf courses

**Satisfaction is guaranteed !**

# TRACTOR GRASSING

# STRAW MULCHING

Our straw mulching service is primarily provided for sediment and erosion control associated with exposed earthworks, but is also available to provide a protective blanket on areas seeded outside of the optimum growing seasons and acts to aid germination in addition to preventing surface erosion.

Straw mulching provides an effective means of sediment control and also facilitates out of season germination by creating a microclimate that protects germinating plants from extreme cold in winter and drying heat in summer months.

# SPECIAL APPLICATIONS

Evergreen Soil Conservation is able to provide solutions that extend beyond simple hydroseeding. We can provide a range of options to best suit your situation. Be it a customised seed mix application or specialised fertiliser requirements, native planting or the provision of erosion control matting or compost filled geotextile fibre erosion control socks.

**“We take all enquiries seriously and will always endeavour to provide the best and most economic solutions for our clients.”**

## EVERGREEN BIOMAT

Evergreen Bio Mat is an enhanced hydroseed mulch with fibre reinforcing. Applied in a thick even coat it is suitable for difficult sites that are prone to the effects of surface water erosion, such as swales and loose soil banks, providing a stable layer that follows the surface contours and resists surface flows.

Swale drain treated with Evergreen BioMat bonded fibre matrix

Evergreen "BioMat" is a bonded fibre matrix designed in house by Evergreen Soil Conservation using locally sourced products. Its primary use is to provide greater surface protection to difficult sites or loose material until vegetation has fully established.
